

Cosmic flow reconstruction from deepest distance surveys (and redshift surveys)

Institut d'Astrophysique de Paris (CNRS)

Collaboration:

Jens Jasche (TUM/ExC),
Michael Hudson (UoW), Benjamin D. Wandelt (UPMC/IAP),
Florent Leclercq (IAP → Portsmouth)

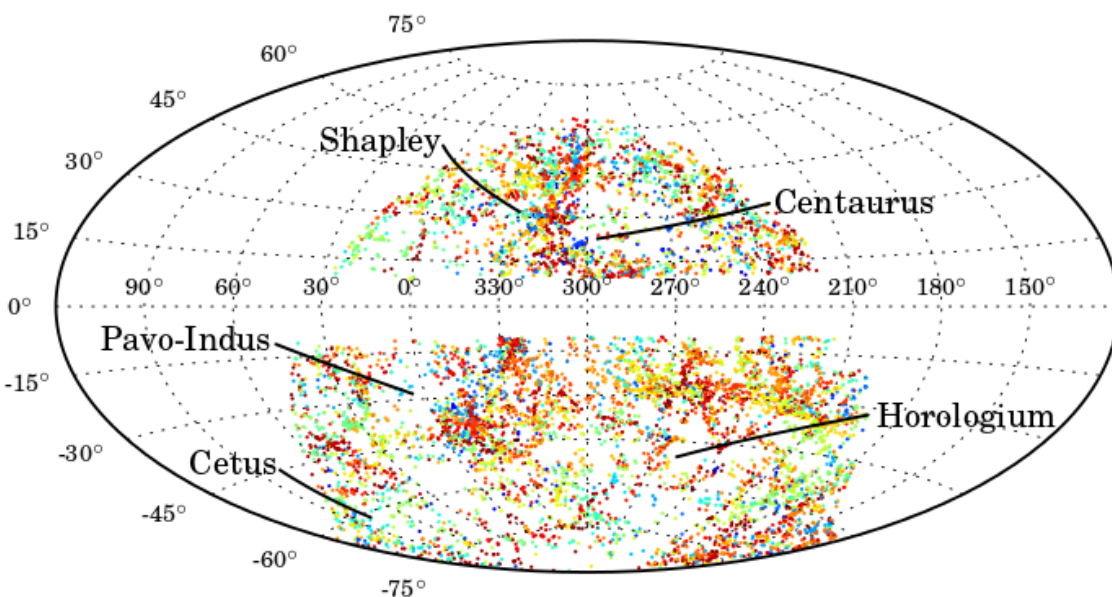

- Context and problems
- The statistical models: BORG (spectroscopic) and VIRBIUS (distance+spectroscopic)
- Application to CosmicFlows, COMPOSITE and 2M++
- Results
- Conclusion

Context

- Cosmic distance surveys coming out of infancy
- Superb spectroscopic surveys

6dFv survey (Springob et al. 2014)
Cosmicflows 3 (Tully et al. 2016)

SDSS3 / BOSS (SDSS website)

- Cosmic distance surveys coming out of infancy
- Superb spectroscopic surveys
- Still naive data analysis

- Cosmic distance surveys coming out of infancy
- Superb spectroscopic surveys
- Still naive data analysis
- Is it possible to do a full and statistically accurate analysis of surveys? Obtain velocity fields?

Galaxy survey

Redshifts (+errors)

VIRBIUS model

VIRBIUS model (effectively)

Hard to write completely here...

The following is only the core part:

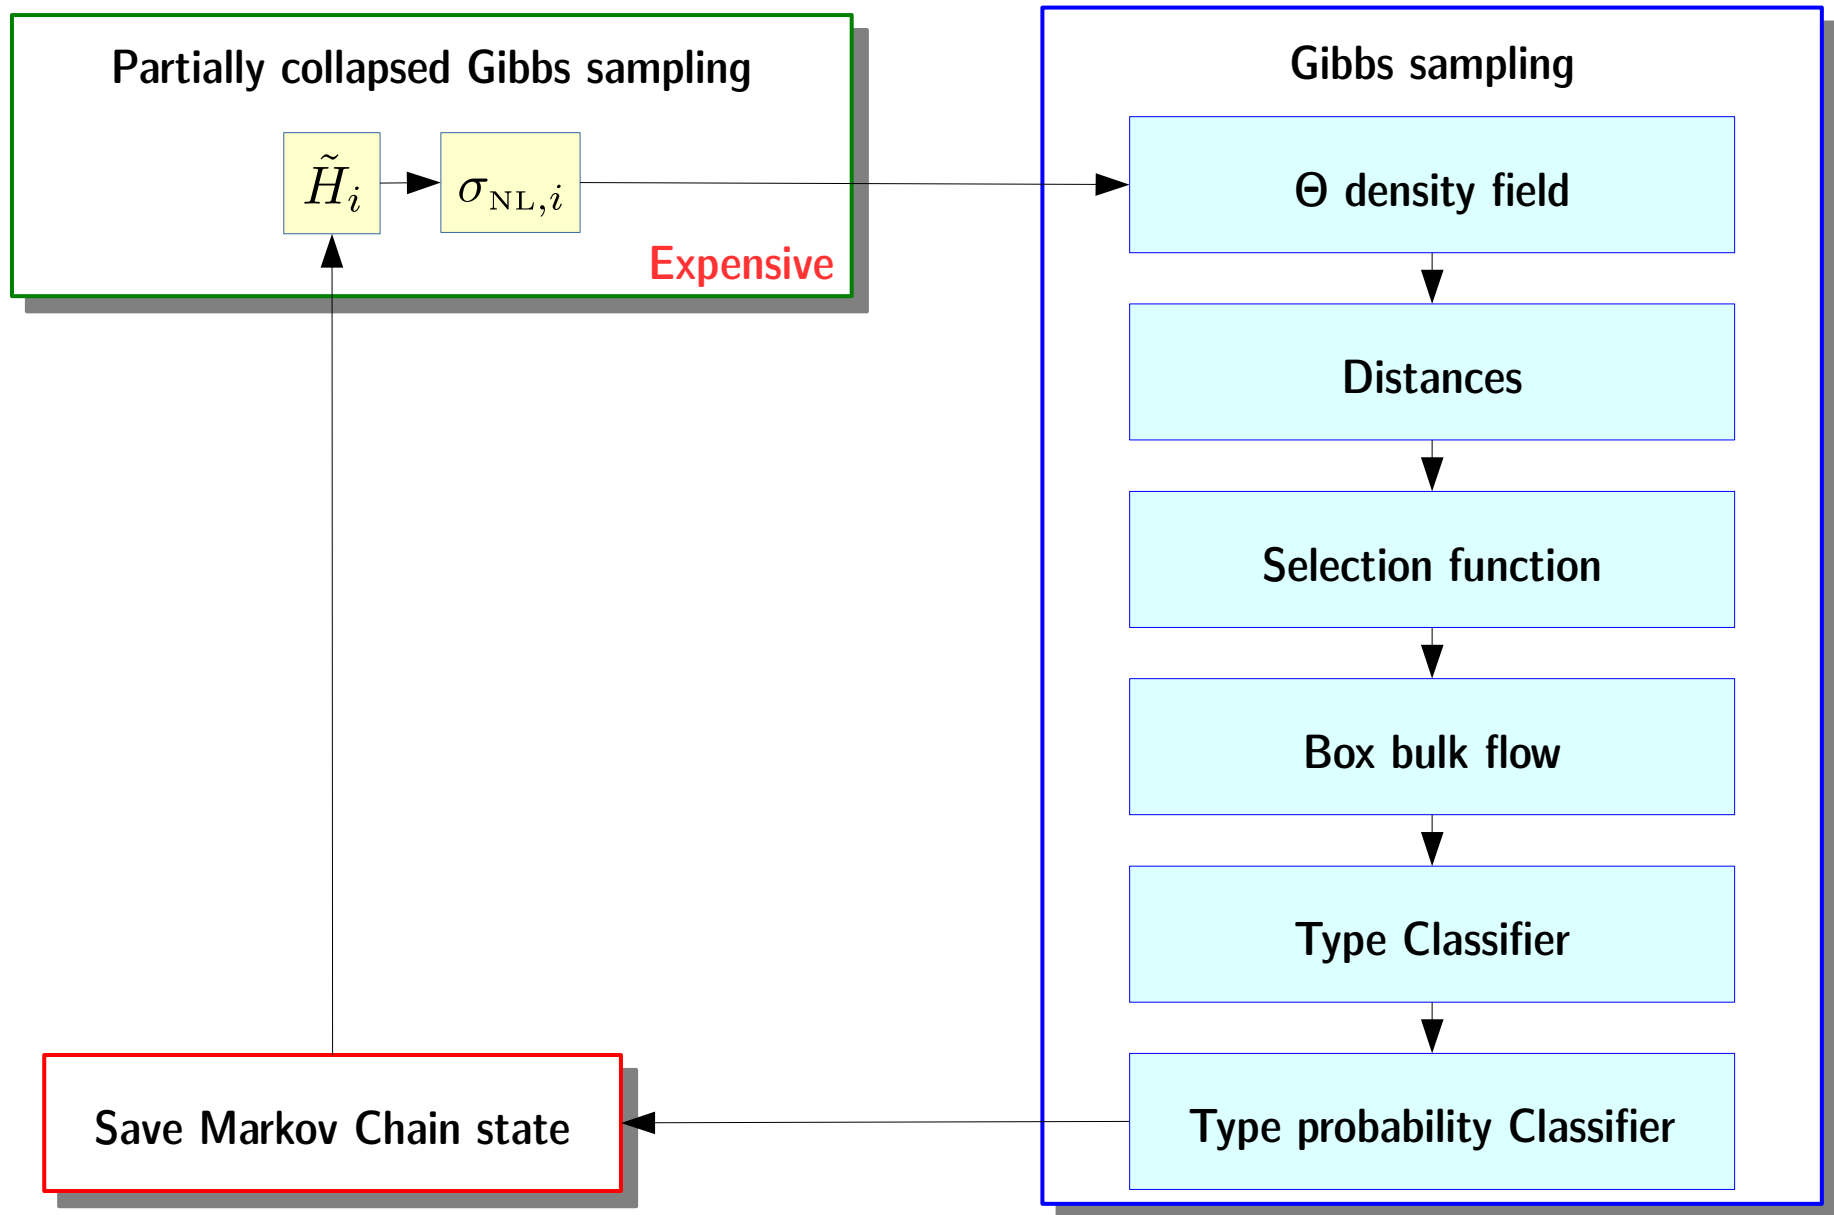

Likelihood

$$\begin{aligned} \mathcal{L} = P(\{\mu_i, z_i\} | \{d_i^L\}, \{\sigma_{z,i}, \sigma_{\mu,i}\}, \{\hat{\Theta}(\mathbf{k}_q)\}, H, \tilde{H}, \Sigma_{\text{NL}}, \mathcal{T}, \{p_t^{\text{type}}\}) \\ \propto \prod_{i=1}^{N_d} (\sigma_{z,i}^2 (1 + \bar{z}_i)^{-2} + \sigma_{\text{NL}, \text{type}(i)}^2)^{-1/2} \times \\ \exp \left\{ -\frac{1}{2} \sum_{i=1}^{N_d} \frac{[v_i^r(z_i, d_i) - H f \Psi_{r,i}(q^h)]^2}{(\sigma_{z,i}^2 (1 + \bar{z}_i(d_i))^{-2} + \sigma_{\text{NL}, \text{type}(i)}^2)} - \frac{(\mu_i - 5 \log_{10}(d_i^L / 10 \text{ pc}))^2}{\sigma_{\mu,i}^2} \right\} \end{aligned}$$

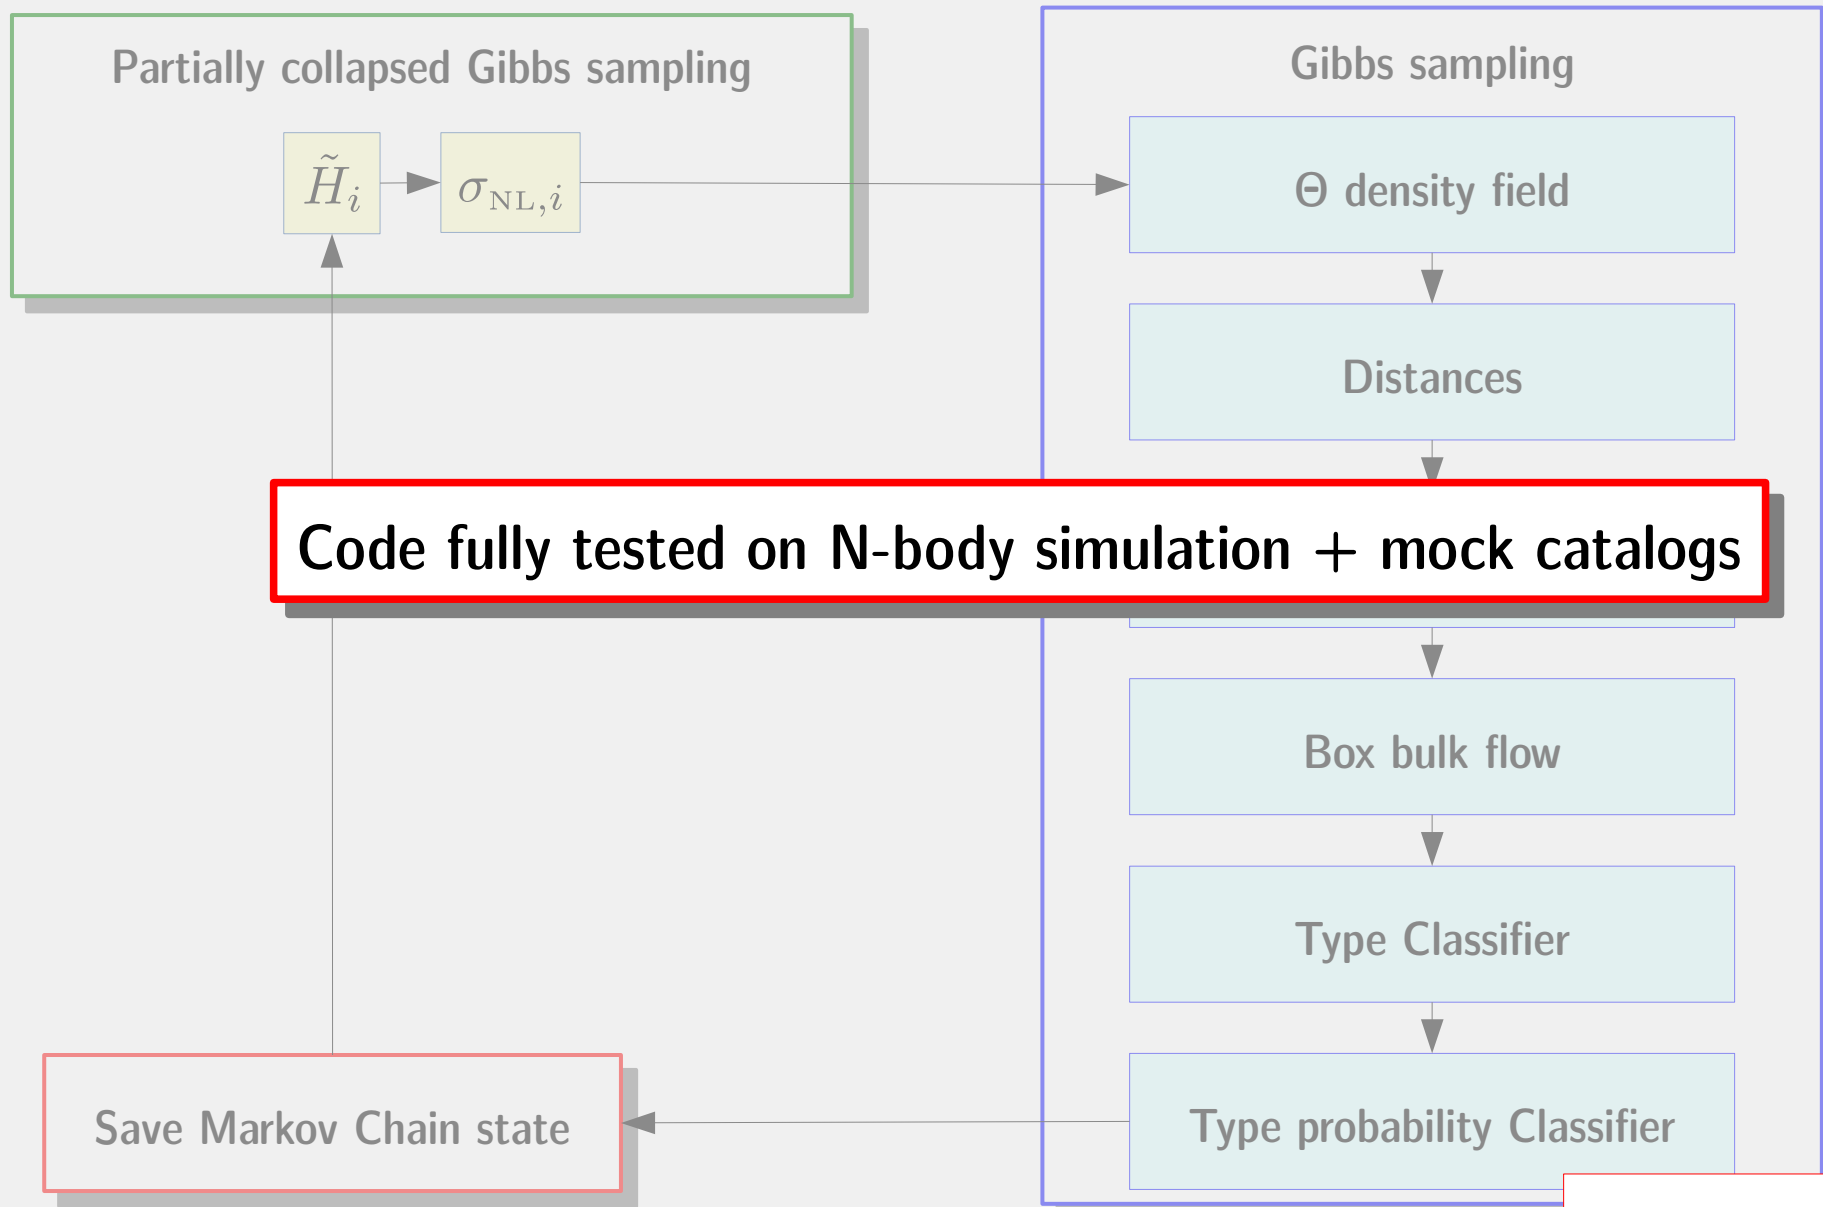

Posterior distribution

$$\begin{aligned} P(\mathcal{D}^L = \{d_i^L\}, \hat{\Theta} = \{\hat{\Theta}(\mathbf{k}_q)\}, \tilde{H}, H, A_S, \{\sigma_{\text{NL},t}\}, \mathcal{T} | \\ \mathcal{M} = \{\mu_i\}, \mathcal{Z} = \{z_i\}, \Sigma_z = \{\sigma_{z,i}\}, \Sigma_\mu = \{\sigma_{\mu,i}\}) = \\ \frac{\mathcal{L} \times \pi(\mathcal{D}^L) \pi(\hat{\Theta}) \pi(\Sigma_{\text{NL}}) \pi(H) \pi(\{\text{type}(i)\}) \pi(A_S)}{\sum_{\mathcal{T}'} \int dH d\hat{\Theta} d\mathcal{D}^L d\Sigma_{\text{NL}} \mathcal{L} \times \pi(\mathcal{D}^L) \pi(\mathcal{T}') \pi(\hat{\Theta}) \pi(\{\sigma_{\text{NL},t}\}) \pi(H)} \end{aligned}$$

CosmicFlows 2.1 data

8188 galaxies

4 subsets:

- "High precision": 558
- Supernovae: 221
- Fundamental plane: 1455
- Tully-Fisher: 5954

Max velocity: 29 313 km/s

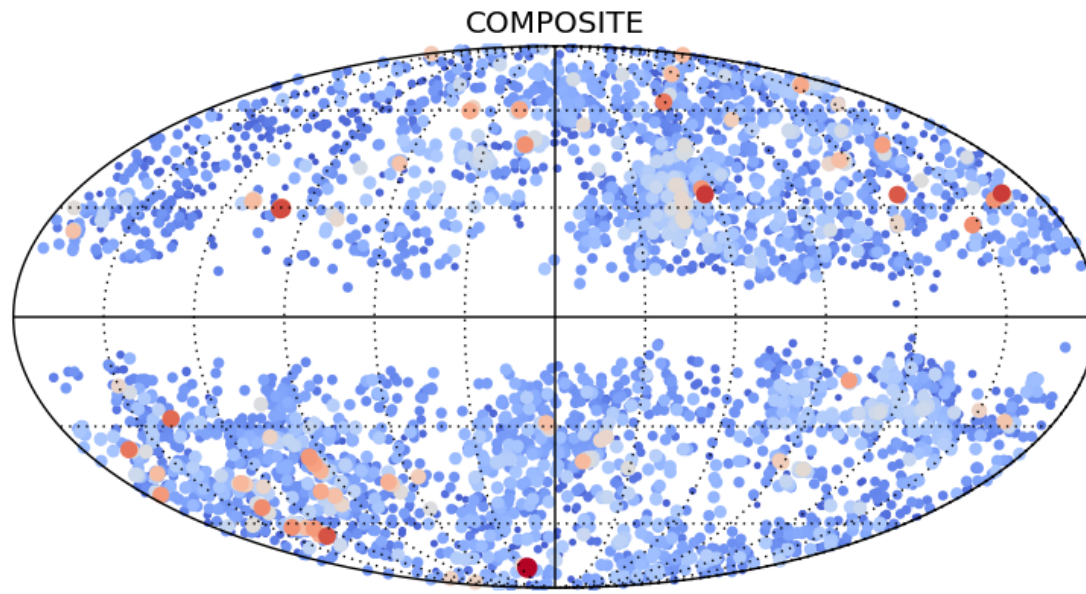

CosmicFlows 2.1 (indicators)

■ Tully-Fisher ■ Supernovae ■ Misc
■ Fundamental plane ■ Surf. brightness fluctuation □ TRGB / Cepheid

Tully et al. (AJ, 2013)

COMPOSITE data

4481 galaxies

1 subset:

- Mixed bag

Max velocity: 42 580 km/s

Watkins, Feldman & Hudson (MNRAS, 2009)

2M++ compilation

Galaxy distribution

SDSS

0 Mpc/h

2MRS

6dF

Redshift completeness

$K < 11.5$

250 Mpc/h
 $11.5 < K < 12.5$

Galactic

Galactic

Lavaux & Hudson (MNRAS, 2011)

VIRBIUS reconstructed fields

PRELIMINARY (!)

CF2.1, mean density and velocity field given data

Supergalactic plane

BORG3 density field

Supergalactic plane, final density field smoothed to 5 Mpc/h (Gaussian)

PRELIMINARY

2M++, mean final matter density field

Supergalactic plane

BORG3 density field

Supergalactic plane, final density field, **no smoothing**

PRELIMINARY

Density + velocity field

PRELIMINARY

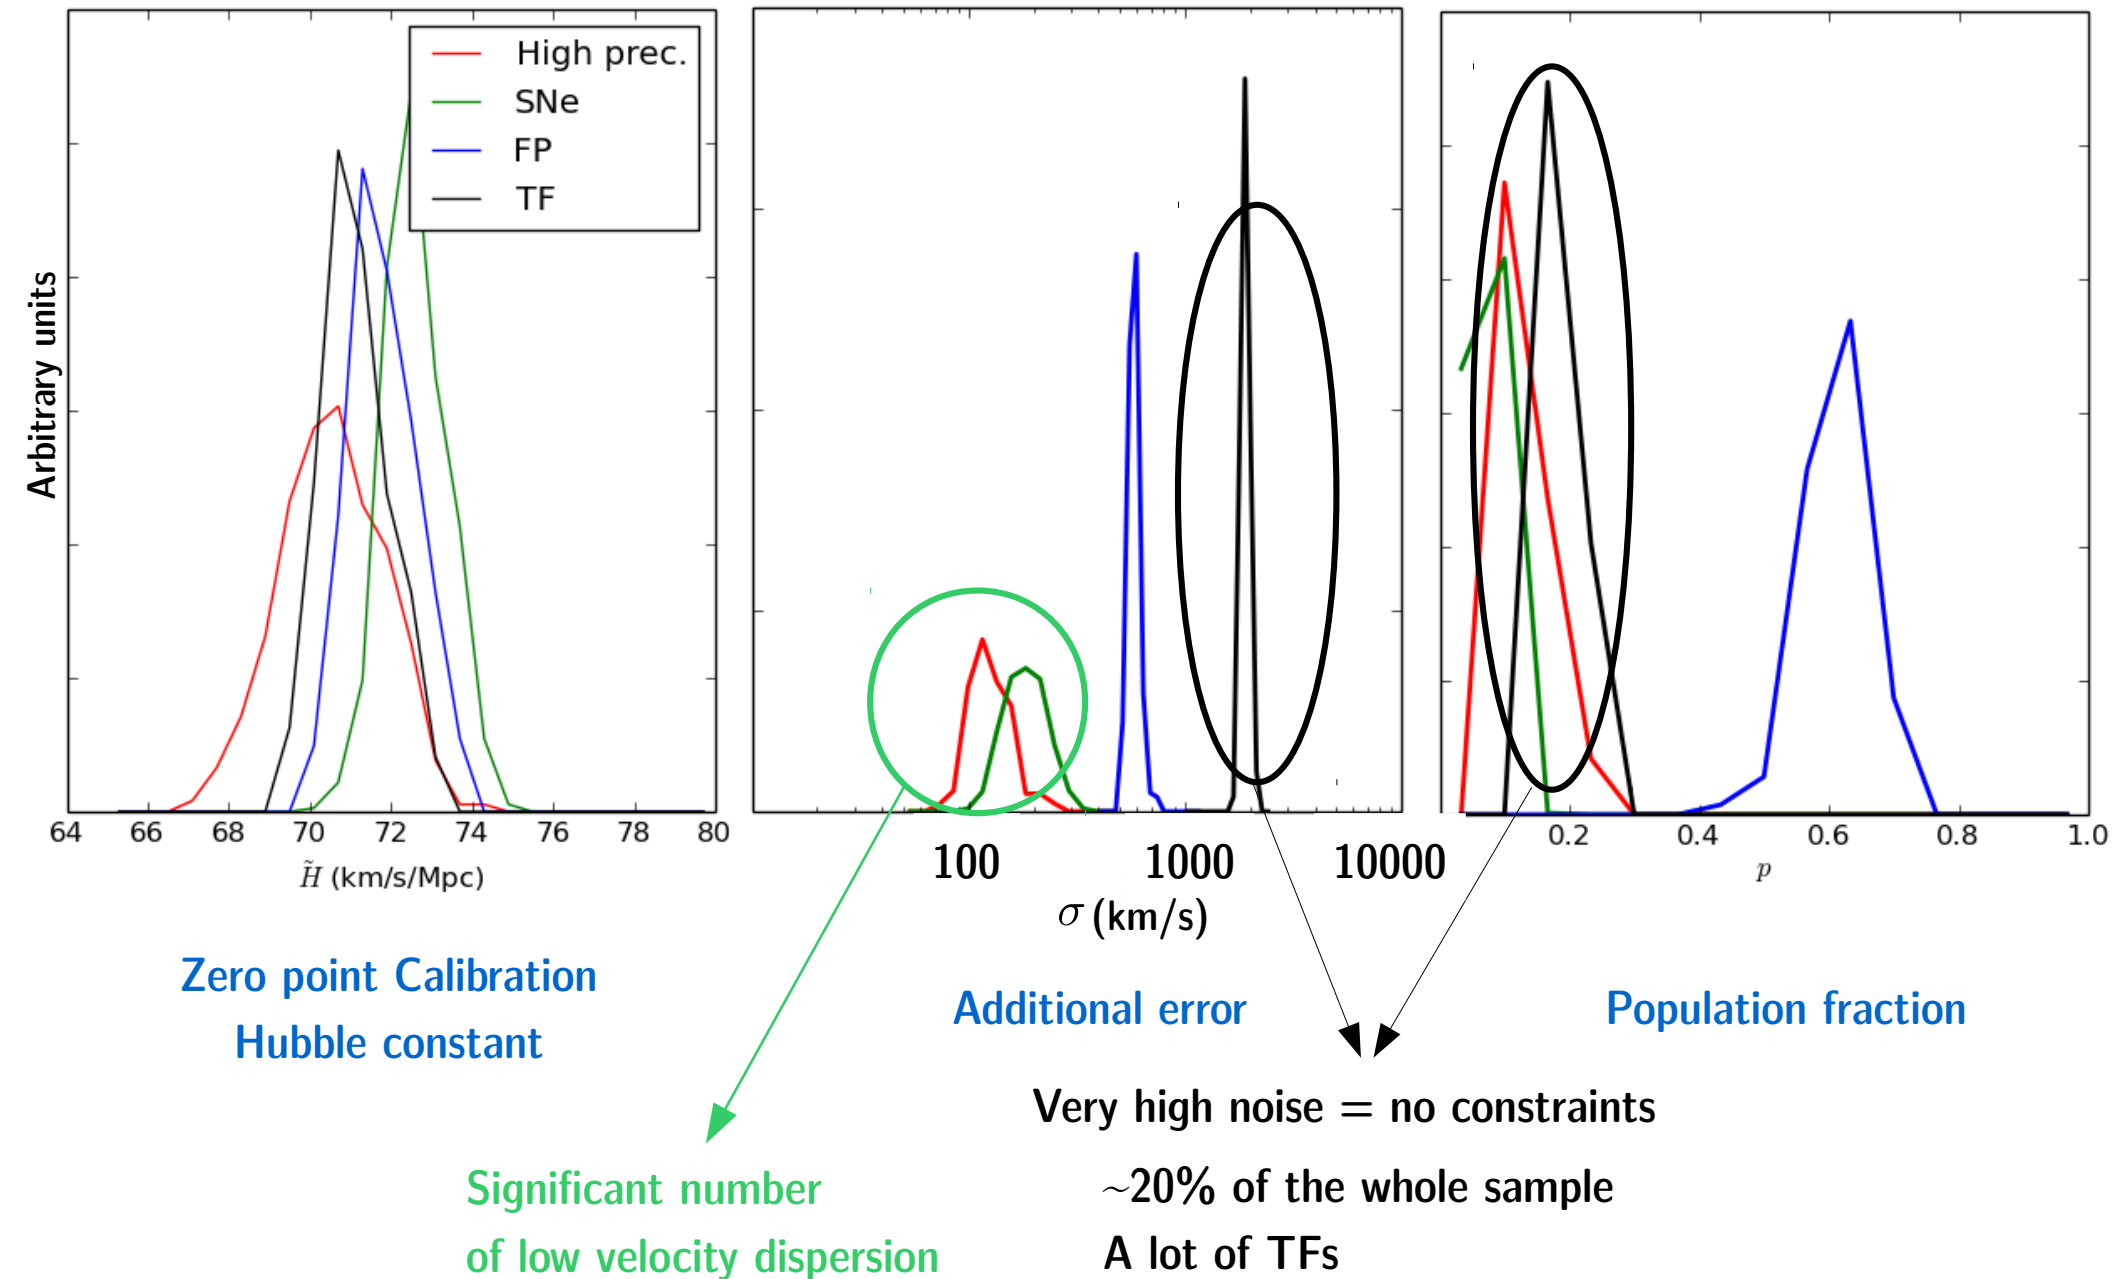

CF2.1, mean divergence field + velocity

2M++, mean final matter density field

Supergalactic plane

Meta-characteristics found by VIRBIUS

Bulk flows (Cosmic Flows 2.1)

PRELIMINARY

Compatible with Hoffman, Courtois & Tully (2015)

Bulk flows (COMPOSITE)

PRELIMINARY

Conclusion

- ✓ Possibility of finding outliers
- ✓ Consistent analysis of different distance data
- ✓ Hubble constant in CF2.1 is more like ~ 70 km/s/Mpc
- ✓ Comparison with BORG, similar topology but details are still sorted out
- ✓ BORG3 opens new possibilities of fully non-linear reconstruction, including also distance data

- ✓ Bulk flows still high in CF2.1, not compatible with LCDM
- ✓ COMPOSITE has no residual non-LCDM bulk flow
- ✓ Both surveys compatible in the inner ~ 60 Mpc/h (Gaussian) region

- ✓ No cosmological parameters fitting yet
